Mollusca (mōl'us-kā), n. pl. An animal sub-kingdom, comprising those soft-bodied animals which are usually provided with an exo-skeleton or shell. They have a distinct alimentary canal, shut off from the general cavity of the body, and situated between the blood-system, which lies along the back, and the nerve-system, which is towards the ventral aspect of the body. The digestive system consists of a mouth, gullet, stomach, intestine, and anus, except in a few forms, in which the intestine ends blindly. The blood is almost colourless. Respiration is variously effected, in the sea-mollusks it takes place mainly by the agency of a crown of ciliated tentacles surrounding the mouth; in the sea-squirts, by a greatly-developed pharynx perforated by numerous ciliated apertures; in the lamp-shells, by long ciliated arms springing from the sides of the mouth; in the bivalve shell-fish, the cuttle-fishes, and most of the univalves, by gills; while in the remainder of the univalves, as snails, slugs, &c., the breathing organs have the form of an air-chamber or pulmonary sac, adapted for breathing air directly. The chief peculiarity, however, of the Mollusca is in the nervous system, which in the lower forms consists essentially of a single ganglionic mass, giving off filaments in various directions; while in the higher there are three such masses, united to one another by nervous cords. According as they possess one or three ganglia the Mollusca are divided into two great divisions—*Mollusca*, those having a single ganglion or principal pair

Mollusca and Molluscoida.

1. *Scaphocephalus* (cuttle-fish) and bone-clam Cephalopoda. 2. *Nerita albicollis*—a gastropod. 3. A periwinkle. 4. *Teredos* (shipworm)—class Brachiopoda. 5. *Cytherea* (clam)—class Lamellibranchiata. 6. *Cynthia papilion*—class Tunicata.

of ganglia, and the *Mollusca* proper, possessing three principal pairs of ganglia. The Mollusca are subdivided into three classes—*Polyzoa*, comprising the sea-mosses and sea-mats; *Tunicata*, the sea-squirts; and *Brachiopoda*, of which Lingula and Teredina (the lamp-shells) are examples. The Mollusca proper are subdivided into four classes—*Lamellibranchiata*, in which there is no distinct head, comprising mussels, scallops, oysters, &c.; *Gastropoda*, com-

prising the land-snails, sea-snails, whelks, limpets, slugs, sea-lemons, etc.; *Pteropoda*, all minute oceanic molluscs; and *Cephalopoda*, the highest class, comprising the cuttle-fishes, calamaries, squids, and the pearly nautilus. The Mollusca are now usually relegated to a distinct sub-kingdom.

Monera (mo-nē-ra), *n. pl.* (Gr *monēra*, solitary.) A name proposed by Haeckel for certain minute marine organisms, which may be provisionally regarded as the lowest group of the Rhizopoda. The body is composed of structureless sarcodae, exhibiting nothing in the way of definite organs, and has, at most, a number of small particles or molecules scattered through it. These organisms exhibit active changes of form, by the formation of pseudopodia—sometimes in the form of broad short lobes, and sometimes as elongated filaments, which are retracted or effaced by the development of others from the adjacent parts of the body. These processes serve as organs of locomotion and prehension, and by means of them the animals take solid matter, which serves as food, into all parts of their body, the undigested exuvie being rejected from all parts in the same indiscriminate way. Reproduction is by fission. The Monera differ from the Foraminifera chiefly, if not entirely, in the absence of a shell. They are supposed to be at the very base of the animal kingdom, or rather according to Haeckel to form a kingdom, *Regnum Protisticum*, between animals and vegetables.

Between the parallels of 10° and 30° south latitude the eastern trade-wind blows regularly, but from the former parallel northwards the course is reversed for half the year, and from April to October the wind blows constantly from the south-west. During the other six months of the year the regular north-east trade-wind prevails. In some places the change of the monsoons is attended with calms; in others, with variable winds, and in others, as in China, with tempests. These tempests seamen call the *breaking up of the monsoons*.—2. An alternating wind in any region. See *extract*.

The word *monsoon* is now used for alternating winds in other regions; and as this custom is becoming popular, it would, perhaps, be well to use the term, in books on Physical Geography, for any winds at any locality whose direction shifts with the seasons, and which divide the year, however unequally, between them. Using the term, then, in this wider sense, we have *monsoons* in the China seas, in the Mexican Gulf, on the coasts of Africa, and South America. *Prof. Young*.

G. *mond*, moon, is a derivative like E. *month*), Lith. *menus*, Gr. *mēnē*, Per. *ma*, Skr. *mā*, all meaning the moon; from a root *mā*, to measure: the moon was early adopted as a measurer of time, hence the name.] 1. The heavenly orb which revolves round the earth; a secondary planet or satellite of the earth, whose borrowed light is reflected to the earth, and serves to dispel the darkness of night. The moon, after the sun, is not only the most conspicuous, but in an astronomical point of view the most interesting of the heavenly bodies. The variety of her phases, her eclipses, and the rapidity with which she changes her place among the fixed stars, drew the attention of the earliest observers of the heavens; while in modern times the important application of the theory of her motions to navigation, and the determination of terrestrial longitudes, has given the lunar theory the first rank among the objects of astronomical science. Among all the heavenly bodies the moon is the nearest to us. The mean distance of its centre from that of the earth is 59 96 of the earth's equatorial radii, or about 237,000 miles; its diameter is 2160 miles, and its magnitude about 1/4 of that of the earth; it completes its revolution round the earth, or makes the tour of the heavens, in a mean or average period of 27 days, 7 hours, 43 minutes, 11 5/6 seconds, which constitutes the *sidereal month*. (See *MONTH*.) The motion of the moon round the earth is subject to great inequalities, arising from the sun's attraction, combined with the different positions of the moon in regard to the earth and sun; it revolves on its own axis in the same time that it takes to revolve round the earth, as appears from its always presenting the same side to the earth. The face of the moon appears to the naked eye diversified by dark and bright patches, which on being examined with a good telescope are discovered to be mountains and valleys, the mountains appearing to be of a volcanic character. The moon has no clouds nor any other indication of an atmosphere.—2. A satellite of any planet; as, the *moons* of Jupiter.—3. The period of a revolution of the moon round the earth; a month. It consists of a cylinder caused to revolve about a vertical axis by the descent of a weight attached to a rope wound round a horizontal axis, the rotation of the cylinder being continually accelerated in accordance with the acceleration of the descending weight. By means of a pencil gently pressed by a spring on a sheet of paper, the horizontal velocity of the cylinder at each unit of time, while the weight is descending is registered. This shows it to increase as the square of the time, or as the numbers 1, 4, 9, 16, &c., thus confirming the theory of falling bodies.

Mormon (mor-mon'), *a.* A member of a sect founded in 1830 by Joseph Smith, a native of the United States. The distinguishing peculiarities of the sect are the belief in a continual divine revelation through the inspired medium of the prophet at the head of their church, the practice of polygamy, and a complete hierarchical organization. The supreme power, spiritual and temporal, rests with the president or prophet (elected by the whole body of the church), who alone works miracles and receives revelations. The Mormons accept both the Bible and the Book of Mormon as divine revelations, but hold them equally subject to the explanation and correction of the prophet. The latter mentioned book (really a kind of historical romance written by one Solomon Spaulding in 1817) pretends to be a history of America from the first settlement of the continent after the destruction of the tower of Babel up to the end of the fourth century of our era, at which time flourished the legendary prophet Mormon, its reputed author. It was said to have been written on gold plates, and concealed until its hiding-place was revealed to Smith by an angel. The Mormons first appeared at Manchester, New York, whence they were compelled by the persecuting hostility of their neighbours to flee, first to Kirtland in Ohio (1831), then to Nauvoo, the 'City of Beauty,' in Illinois (1839), and finally to the Salt Lake in Utah (1847). In 1844 the founder, Joseph Smith, was shot by a mob in Carthage prison, where his lawless behaviour had brought him. The sect has continued to increase, and can claim adherents in most parts of the world. They call themselves the Church of Jesus Christ of Latter-day Saints. The advance made by Mormonism seems to have been due far more to the addition of Brigham Young, the successor of Smith, than to the founder himself, who was little better than a dissipated and immoral scamp.

If the mortgage is not duly redeemed in the time and manner specified in the instrument by the mortgagor the mortgagee acquires by common law the absolute title to the property. But in this case courts of equity may interpose and give the mortgagor a right of re-entry on his property on condition of subsequent payment of his obligation with interest. This is called the *equity of redemption*, and may be exercised within twenty years of the mortgagee's entry on the estate or of his last-written acknowledgment of the mortgagor's interest in it. On the other hand, the mortgagee may, on the violation of the condition of the mortgage, by filing a bill of foreclosure, compel the mortgagor either to redeem his pledge or forfeit his equity of redemption. Moschidae (mos'ki-dé), *n. pl.* [See MOSCHUS.] A family of ruminant quadrupeds, familiarly known as musk-deer, of central and northern Asia. It corresponds to the genus *Moschus* of Linnaeus. They differ from the ordinary ruminants only in the absence of horns, in having a long canine tooth on each side of the upper jaw, which, in the male, issues from the mouth, and finally in having a slender fibula. These animals are remarkably light and elegant. See MUSK-DEER.

The architectural character of mosques is usually peculiar; the square shape, the dome, the minaret from which the muezzin call the faithful to prayer, and the arched Saracenic gateway are common features. Connected with almost every mosque is an open court and colonnade, containing a fountain for ablutions. The principal interior decoration of mosques consists in the lamps, which are numerous and singularly disposed; the direction of Mecca is pointed out by a niche or recess called the *mihrab* (which see), or by a tablet, inscribed with verses of the Koran. A class of mosques are set apart for the instruction of young men, and with many of the larger there are hospitals and public kitchens connected for the benefit of the poor.

as the *fillet*, *torus*, *listel*, *regula*. Second, the curved, as the *astragal* or *bead*, the *torus*, the *cavetto*, the *quarter-round*, *ovolo*, or *echinus*. Third, the composite, as the *ogee*, *balon*, or *cyana reversa*, the *cyana recta* or *doveline*, and the *scotia* or *trochilus*, all of which are known by many other synonyms. with *aplays* and *fillets*; and a striking peculiarity of this style is the recurrence of mouldings broken into zigzag lines. In the

Mummy (mum'i), *n.* [*Fr. mumie*, *memie*, *Sp. momia*, *It. mummia*, from *Ar. mûmia*, from *mûm*, wax; Coptic *mum*, bitumen, gum-resin.] 1. A dead human body embalmed and dried after the manner of those taken from Egyptian tombs. An immense number of mummies have been found in Egypt, consisting not only of human bodies, but of various animals, as bulls, apes, ibises, crocodiles, fish, &c. The processes of embalming bodies were very various. Those of the poorer classes were merely dried by salt or natron, and wrapped up in coarse cloths. The bodies of the rich and the great underwent the most complicated operations, and were laboriously adorned with all kinds of ornaments. The embalmers extracted the brain through the nostrils, and the entrails through an incision in the side. The body was then shaved and washed, the belly filled with perfumes, the whole body covered with natron, and steeped in the same material for seventy days. After this the body was washed, steeped in balsam, and then wrapped up in linen bandages, sometimes to the number of twenty thicknesses; various ornaments were placed above the bandages, particularly about the head. The body was then put into an ornamented case of sycamore wood. Sometimes the cases were double. The Egyptian mode of embalming was imitated occasionally by the Jews, Greeks, Romans, and other nations. The term *mummy* is likewise given to human bodies preserved in other ways, either by artificial preparation or by accident. The Guanches, or ancient people of the Canaries, embalmed their dead in a simple but effectual manner; and one cavern in Tenerife when discovered had upwards of a thousand mummies in it, several of which had distinct, though contracted features. In some situations, the conditions of the soil and atmosphere, by the rapidity with which they permit the drying of the animal tissues to be effected, are alone sufficient for the preservation of the body in the form of a mummy. This is the case in some parts of Peru, especially at Arica, where considerable numbers of bodies have been found quite dry, in pits dug in a saline dry soil. And in some countries natural mummies are occasionally found in caverns. During the fifteenth and sixteenth centuries mummies were used for nostrums against disease, and other medical purposes, and a peculiar brown colour, used as the background of pictures, was obtained from the bitumen.—2. † Liquor which distills from mummies; a liquor prepared from dead bodies and considered to have very potent qualities; a medicinal liquor or gum in general.

May we not . . . consider his history of the fall as an excellent mythologue to account for the origin of human evil?
Dr. A. Goldie.

Mythology (mith-o-lō'j'ī), *n.* [*Gr. mythos*, a fable, and *logos*, discourse.] 1. The science of myths; the science which investigates myths with a view to their interpretation and to discover the degree of relationship existing between the myths of different peoples; a treatise on myths.—2. A system of myths or fables in which are embodied the convictions of a people in regard to their origin, divinities, heroes, founders, &c. See *MYTH*.

Myxinidae (miks-in'i-dē), *n. pl.* (See *MYXINE*.) The hag-fishes, a family of vermiform, eel-like fishes, of Owen's order Marsipobranchii. They possess no paired fins to represent limbs, but have a median fin running round the hinder extremity of the body. The skeleton is cartilaginous, the chorda dorsalis persistent, and the only traces of vertebrae are hardly perceptible rings of osseous matter developed in the sheath of the notochord. The mouth is sucker-like, destitute of jaws, but provided with tractile filaments or cirri. In the centre of the palate is a single large recurved fang, with its sides strongly serrated, by means of which the animal bores its way into its victim, having previously attached itself to it by its suckorial mouth. The glutinous hag (*Myxine glutinosa*) is one of the best known species. See *HAG*.

The spores of these organisms are very similar to the amoebæ, moving about in water like them by emitting and withdrawing pseudopodia, and taking into their substance solid particles as nutriment, and in this form they have been called *Myxamœbæ*. Several of these may join together to form a single mass of protoplasm called a plasmodium, which grows by taking in and assimilating solid nutriment, and finally becomes converted into the net-work above mentioned.

Myxomycetous (mik'sō-mi-sē'tus), *a.* Pertaining to the Myxomycetes.

Myxon (miks'on), *n.* A fish of the mullet kind. *Ash.*

See *MONERA*.

N.

N is the fourteenth letter and the eleventh consonant of the English alphabet. Its ordinary sound, as in *not*, *run*, is formed by placing the tip of the tongue against the palate at or close behind the root of the upper teeth, and sending a voiced sound through the nose. It differs from *m* in the fact that the tongue and roots of the teeth are brought together instead of the lips, that is, it is a dental nasal instead of being (like *m*) a labial nasal. Before gutturals it slides into a guttural nasal sound, as in *snk*, *Anger*, a sound also represented by the digraph *ng*, as in *sing*. When the gutturals belong to a different syllable the *n* may retain its other

sound, as in *enquif*, *congratulate*, *jonquil*, &c. When final after *m* it is silent, as in *hymn* and *condemn*. As an initial sound it occurs alone or after the consonants *g*, *k*, *m*, *p*, these consonants in this position being silent. The initial combinations *pn*, *kn*, as in *gnaw*, *know*, belong to words of Teutonic origin, and the *g* or *k* (*o*) were formerly pronounced distinctly along with the *n*, as they still are in some of the dialects, Scotch for instance. The initial combinations *mn* and *pn*, as in *mnemonic*, *pneumatic*, occur only in words from the Greek. The only consonant which is always sounded before *n* initial is *s*, as in *snare*, *snow*, &c. No consonant

can come after it at the beginning of a syllable. At the end it may be followed by the dentals *d* and *t*, the guttural *k* (with *g* it forms a single sound), and the sibilant sounds *s*, *z*, *sh* (or their equivalents), all of which are sounded distinctly. At a very early stage of the language it was rejected from words in which it came before *f*, *s*, and *th*, and thus it has disappeared from *soft*, *goose*, *tooth*, &c. It has also been lost in various other cases. Thus *auger*, *adder*, *apron*, should properly have an *n* at the beginning, while *ell*, *well*, once had *n* at the end. *Newt*, on the other hand, has borrowed its *n* from an the indefinite article. In *nightingale*, *messen-*

ger, passenger, it is likewise an intrusive element. In many cases, both in English and other languages, *n* final has been felt as too weak a sound by itself, and a strengthening element has been added, hence the *d* in *thunder, sound*, and the *t* in *tyrant*. In *comfort m* was originally *n*; in *event, n* was *m* originally. — As a numeral *N* signified 900, and with a stroke over it, *N̄*, 9000. — As an abbreviation, *N* stands for north; *N.B.* for nota bene, note well, and North Britain or Scotland; *N.P.* for notary public, &c.

N.

N is the fourteenth letter and the eleventh consonant of the English alphabet. Its ordinary sound, as in *not*, *run*, is formed by placing the tip of the tongue against the palate at or close behind the root of the upper teeth, and sending a voiced sound through the nose. It differs from *m* in the fact that the tongue and roots of the teeth are brought together instead of the lips, that is, it is a dental nasal instead of being (like *m*) a labial nasal. Before gutturals it slides into a guttural nasal sound, as in *sink*, *finger*, a sound also represented by the digraph *ng*, as in *sing*. When the gutturals belong to a different syllable the *n* may retain its other

sound, as in *engulf*, *congratulate*, *jonquil*, &c. When final after *m* it is silent, as in *hymns* and *condemn*. As an initial sound it occurs alone or after the consonants *g*, *k*, *m*, *p*, these consonants in this position being silent. The initial combinations *gn*, *kn*, as in *gnaw*, *know*, belong to words of Teutonic origin, and the *g* or *k* (*c*) were formerly pronounced distinctly along with the *n*, as they still are in some of the dialects, Scotch for instance. The initial combinations *mn* and *pn*, as in *mnemonic*, *pneumatic*, occur only in words from the Greek. The only consonant which is always sounded before *n* initial is *s*, as in *snare*, *snow*, &c. No consonant

can come after it at the beginning of a syllable. At the end it may be followed by the dentals *d* and *t*, the guttural *k* (with *glt* forms a single sound), and the sibilant sounds *s*, *z*, *sh* (or their equivalents), all of which are sounded distinctly. At a very early stage of the language it was rejected from words in which it came before *f*, *s*, and *th*, and thus it has disappeared from *soft*, *goose*, *tooth*, &c. It has also been lost in various other cases. Thus *auger*, *adder*, *apron*, should properly have an *n* at the beginning, while *ell*, *mill*, once had *n* at the end. *Neut*, on the other hand, has borrowed its *n* from *an* the indefinite article. In *nightingale*, *messen-*

ger, passenger, it is likewise an intrusive element. In many cases, both in English and other languages, *n* final has been felt as too weak a sound by itself, and a strengthening element has been added, hence the *d* in *thunder, sound*, and the *t* in *tyrant*. In *comfort* *m* was originally *n*; in *event*, *n* was originally *n*.—As a numeral *N* signified 900, and with a stroke over it, *N̄*, 9000.—As an abbreviation, *N* stands for north; *N.B.* for nota bene, note well, and North Britain or Scotland; *N.P.* for notary public, &c.

ment, subdivided by a diagonal line into two triangles. A sufficient number of rods must be provided for each of the headings, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, so that by placing the proper rods side by side any number may be seen at the top, while the several multiples occupy, in order, the eight lower compartments; when the multiple consists of two figures these are placed one on each side of the diagonal line. There is also a rod called the *index-rod*, the squares on which are not subdivided into triangles. To multiply, for example, the number 6789 by 54. Place four of the rods together, so that the top numbers form the multiplicand; then look on the index-rod for 6, the first number of the multiplier, and on the corresponding compartments of the four rods the following

disposition of figures will be found ranged in the two lines formed by the triangles of each square . . . 6284 3446

These added together make 40784

Against 5, on the index-rod, the figures are 0505 2344

The products when added give the sum required 380184

Division is performed in an analogous manner.

These zones being condensed, and partaking of the primary rotation, constituted the planets, some of which in turn threw off zones which now form their satellites. The main body being condensed towards the centre formed the sun.

When substances thus mutually disguise each other's properties they are said to *neutralize* each other. The term *neutralization* is also applied to the decomposition of the alkaline carbonates by the gradual addition of some acid more powerful than the carbonic.

In contradistinction to the *London Gazette*, then the only authorized newspaper, and which contained little more than ordinary proclamations and advertisements.

The people who lived at a distance from the great theatre of political contention could be kept regularly informed of what was passing there only by news-letters. To prepare such letters became a calling in London, as it now is among the natives of India. The news-writer rambled from coffee-room to coffee-room, collecting reports, squeezed himself into the sessions house of the Old Bailey if there was an interesting trial, nay, perhaps obtained admission to the Gallery of Whitehall, and scoured how the king and duke looked. In this way he gathered materials for weekly epistles destined to enlighten some country town or some bench of rustic magistrates. Such were the sources from which the inhabitants of the largest provincial cities and the great

body of the gentry and clergy learned almost all they knew of the history of their own time.

Every publication giving original reports of parliamentary debates keeps one of a series of reporters constantly in the gallery of the Lords, and another in that of the Commons. These are at stated periods relieved by their colleagues, when they take advantage of the interval to transcribe their notes, in order to be ready again to resume the duty of note-taking, and afterwards that of transcription for the press. A succession of reporters for each establishment, varying from ten or eleven to seventeen or eighteen, is thus maintained, and the process of writing from their notes never interrupted, till a complete account of the debates of the evening has been committed to the hands of the printer.

They were ornamented with pillars, architraves, consoles, and in other ways. In the architecture of the middle ages niches were extensively used as decorations for the reception of statues. In the Norman style they were so shallow as to be little more than panels, and the figures were frequently carved on the back in alto-relievo. In the Early English style they become more deeply recessed and are highly enriched, and in the Decorated style they become infinitely varied. Their plans chiefly consisted of a semi-octagon or a semi-hexagon, and their heads were formed into groined vaults, with ribs, and bosses, and pendants. They were projected on corbels, and adorned with pillars, buttresses, and mouldings of various kinds, and had canopies added to them which were flat and projecting in every variety of plan, and elaborately carved and enriched. In the Perpendicular style this variety and elaboration continued.

The sufferer awakens after a short time in a state of great terror, the body often covered with sweat. The proximate cause of nightmare is said to

(One who has attained this condition will at death pass entirely out of existence.)

What then is *Nirvana*, which means simply going out, extinction, it being quite clear, from what has gone before, that this cannot be the extinction of a soul. It is the extinction of that soul, erasing condition of mind and heart, which would otherwise according to the great mystery of Karma, be the cause of renewed individual existence. That extinction is to be brought about by and runs parallel with the growth of the opposite condition of mind and heart, and it is complete when that opposite condition of mind and heart is reached. *Nirvana* is therefore the same thing as a sinless, calm state of mind and if translated at all, may best perhaps be rendered

holiness—holiness, that is, in the Buddhist sense, perfect peace, goodness, and wisdom.

Whence the writ, as well as the commission, received the name of *nisi prius*. The judges of assize, by virtue of their commission of *nisi prius*, try the civil causes thus appointed in their several circuits, being said to sit at *nisi prius*, and the courts in which these actions are tried being called courts of *nisi prius*, or *nisi prius* courts. A trial at *nisi prius* may be defined in general as a trial, before a judge and jury, of a civil action that has been brought in one of the superior courts.—*Nisi prius record*, a document containing the pleadings that have taken place in a civil action for the use of the judge who is to try the case.

When silver is oxidized and dissolved by nitric acid diluted with two or three times its weight of water it forms a solution which yields transparent tabular crystals on cooling, which are called nitrate of silver. When fused the nitrate is of a black colour, and may be cast into small sticks in a mould; these sticks form the *lapis infernalis* or *lunar caustic* employed by surgeons as a cantry. It is sometimes employed for giving a black colour to the hair, and is the basis of the indelible ink for marking linen. Its solution is always kept in the laboratory as a test for chlorine and hydrochloric acid. Called also *Argentis Nitrate*.—*Nitrate of soda*, a salt analogous in its chemical properties to nitrate of potash or nitre. It commonly crystallizes in obtuse rhombohedrons. It is found plentifully in Peru, and is imported into England from America. It is used as a manure and as a source of nitric acid. Called also *Sodic Nitrate* and *Cubic Nitre*.

It is generated spontaneously in the soil, and crystallizes upon its surface in several parts of the world, and especially in the East Indies, whence the greater part of the nitre used in Great Britain is derived. In some parts of the Continent it is prepared artificially from a mixture of common mould or porous calcareous earth with animal and vegetable remains containing nitrogen. It is a colourless salt, with a saline taste, and crystallizes in six-sided prisms. It is chiefly employed in chemistry as an oxidizing agent and in the formation of nitric acid. Its chief use in the arts is in the making of gunpowder. It also enters into the composition of fluxes, and is extensively employed in metallurgy; it is used in the art of dyeing, and is much employed in the preservation of meat and animal matters in general. In medicine it is prescribed as cooling, febrifuge, and diuretic.—*Cubic nitre*. Same as *Nitrate of Soda* (which see under *NITRATE*).

Nitric (ni'trik), *a.* An adjective used in the nomenclature of the oxygen compounds of nitrogen. See *NITROUS*.—*Nitric acid* (HN O₃), a most important acid, prepared by distilling a mixture of sulphuric acid and nitre. It is a most powerful oxidizing agent, and is decomposed by almost all the metals. When pure it is a colourless liquid, but is usually yellowish, owing to a small admixture of oxides of nitrogen. Its smell is very strong and disagreeable; and it is so acid that it cannot be safely tasted without being much diluted. It acts with great energy on most combustible substances, simple or compound, and upon most of the metals. It exists in combination with the bases potash, soda, lime, magnesia, in both the vegetable and mineral kingdoms. It is employed in etching on steel or copper; as a solvent of tin to form with that metal a mordant for some of the finest dyes; in metallurgy and assaying; also in medicine, in a diluted state, as a tonic and as a substitute for mercurial preparations in syphilis and affections of the liver; and also in form of vapour to destroy contagion. It closely resembles oil of bitter almonds in flavour, and though it has taken a prominent place amongst the narcotic poisons, it is largely employed, as a substitute for that oil, in the manufacture of confectionery and in the preparation of perfumery. It is important as a source of aniline in the manufacture of dyes. It is known also as *Essence of Mirbane*, a fancy name given to it by M. Collas of Paris. See *ANILINE*.

Nitro-calcite (ni'tro-kal'sit), *n.* Native nitrate of lime. It occurs as a pulverulent efflorescence on old walls and limestone rocks, has a sharp bitter taste, and is of a grayish-white colour. This is said to be the form in which the so-called nitre for the most part occurs.

Nitrogen (ni'tro-jen), *n.* [*Gr. nitron*, nitre, and *gennao*, to produce.] Sym. N.; equivalent, 14; sp. gr. 0.9713. That element which is the basis of nitric acid, and the principal ingredient of atmospheric air. It is an important elementary principle; it constitutes about four-fifths of common air, the rest being principally oxygen. In its pure state it is remarkable for its negative qualities; that is to say, for the difficulty with which it enters into combination with other matters. It is neither combustible nor a supporter of combustion; it is neither acid nor alkaline; possesses neither taste nor smell. It is most readily obtained from atmospheric air, but it may also be obtained from animal matters. There are five known compounds of nitrogen and oxygen, viz. nitrous oxide, N₂O; nitric oxide, N₂O₂; nitrogen trioxide, N₂O₃; nitrogen tetroxide, N₂O₄; nitrogen pentoxide, N₂O₅.

nected with that art or science, as in arithmetic and algebra, for expressing numbers and quantities. In the common or denary scale of notation employed in arithmetic every number is expressed by means of the ten digits, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, by giving each digit a local as well as its proper or natural value. The value of every digit increases in a tenfold proportion from the right towards the left; the distance of any figure from the right indicating the power of 10, and the digit itself the number of those powers intended to be expressed; thus $3464 = 3000 + 400 + 60 + 4 = 3 \times 10^3 + 4 \times 10^2 + 6 \times 10 + 4$. This scale of notation was introduced into Europe by the Arabs about the latter end of the tenth century. The Roman notation, which is still used in marking dates or numbering chapters, consists of seven characters, viz. I. one; V. five; X. ten; L. 50; C. 100; D. or IJ. 500; M. 1000, sometimes expressed by *DG* or *CIG*. In regard to expressing numbers by this notation, it may be observed that, as often as any character is repeated, so many times is its value repeated; a less character before a greater diminishes its value by the less quantity; and a less character after a greater increases its value by the less quantity. The ancient Greeks represented numbers by means of the letters of their alphabet, to which they added three obsolete characters.—*Architectural notation*, a method adopted of placing signs to figures when marking dimensions on drawings; as 'for feet,' 'for inches, and 'for parts, &c.—*Chemical notation*, a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols. O.

O is the fifteenth letter and the fourth vowel in the English alphabet. The shape of this letter seems to have been taken from the circular configuration of the lips in uttering the sound. The sound that was originally represented by this letter was no doubt a pure vowel sound, such as that in *mortal*, which is also the sound it generally has in the continental tongues. This was not one of the original Aryan vowel sounds (these being a, ē, and ō sounded as in Latin or Italian), but arose from the modification of an original *o* or *u*. (See A.) This sound is produced by protruding the lips with a rounded opening, and *o* is therefore called the labial vowel, *i* (*y*) being the palatal, and *e* (*ē*) the guttural. In English *O* has seven distinct sounds and shades of sound: (1) as in *note*, which, as commonly pronounced in the South of England, is really a diphthong, *o* and *u* being pronounced as a

O, interj. 1. An exclamation used in earnest or solemn address, appeal, or invocation, and prefixed to the noun of address. In practice authors do not always preserve a distinction between this particle and *oh*, a particle of emotion prefixed to a sentence or clause expressing sentiment or passion. As regards punctuation, when *O* is, or should be, the word, the mark of exclamation, if employed at all, is placed after the noun of address; as, 'Hear, *O* Israel!' but when *oh* is the proper word, the mark is placed immediately after it, thus, *oh*!—*Oh, dear!* and *Oh, dear me!* exclamations expressive of surprise, uneasiness, or exhaustion, fear, pain, and the like. They are regarded as corruptions of *Fr* *O* *Dies!* or *It* *O* *Dio!* *O* *God!* and *It* *O* *Dio mio!* *O* my God!—2. Used as a noun.

Why should you fall into so deep an *O*? *Shak.*

Oak (*ōk*), n. [A. Sax. *āc*, a name of this tree common to the Teutonic tongues; Sc. *oak*, *loel*, *etc.* D. *oek*, L.G. *oek*, Dan. *oeg*, Sw. *ok*, G. *eiche*. Root meaning unknown.] The English name of the trees and shrubs belonging to the genus *Quercus*, nat. order Cupulifera; also its wood. The oak from the remotest antiquity has obtained a pre-

eminence among trees, and has not unjustly been styled the 'monarch of the woods.' In the traditions of Europe and a great part of Asia the oak appears as a most important element in religious and civil ceremonies. It was held sacred by the Greeks and Romans, and no less so by the ancient Gauls and Britons. The species of oak are very numerous, generally natives of the more temperate parts of the northern hemisphere. They have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous. The common oak attains a height of from 60 to 100 or even 150 feet, with a diameter of trunk of from 4 to 8 feet. Noble specimens of oak-trees, and some of them historically celebrated, exist in almost all parts of Britain, but are much more frequent in England than in Scotland. The oak subserves a greater number of useful purposes than almost any other kind of forest tree,

the wood being hard, tough, tolerably flexible, strong without being too heavy, not readily penetrated by water, and bearing alternations of wet and dry better than most other woods. For more than a thousand years British ships were mainly built of common oak (*Q. robur*). The American white oak (*Q. alba*) and the live-oak (*Q. vivax*) were also much used for the same

purpose. The bark of the oak-tree is very valuable, and is preferred to all other substances for the purpose of tanning. Gallic acid exists abundantly in the oak. The leaves of *Q. falcata* are employed, on account of their astringency, externally in cases of gangrene; and the same astringent principle which pervades all the species has caused them to be employed as febrifuges, tonics, and stomachics. Cork is the bark of *Q. suber*, or cork oak. (See *CORK*.) Galls are the produce of *Q. infectoria*. (See *GALL*.) The name oak is sometimes popularly applied to timber of very different genera; thus African teak is often called African oak; while in Australia

a dash over it, *Ō*, for 11,000.—In old usage, *O* was a mark of triple time (*tempus perfectum*), from the notion that the ternary, or number 3, is the most perfect of numbers, and properly expressed by a circle, the most perfect figure.

Ocean (ô'shan), n. [L. *oceanus*, from Gr. *ôkeanos*, the ocean.] 1. The vast body of water which covers more than three-fifths of the surface of the globe; the sea. Although no portion of it is completely detached from the rest, the ocean has often been divided into several great basins or areas, viz. the Pacific Ocean, the Atlantic Ocean, and the Indian Ocean, the great bodies of water which divide the land-masses of the Old and New Worlds, and which intervene between the former and the southern continent, Australia; together with the Arctic and the Antarctic Oceans, round the north and south poles respectively. Between these no very definite limits can be drawn; thus it is impossible to say where the Atlantic or the Pacific ends, and the Arctic or Southern Ocean begins. The Arctic Ocean, at least that portion of it that washes the northern shores of Europe and Asia, is often treated as a portion of the Atlantic basin. The minor ramifications of the ocean into land are known as seas, bays, gulfs, creeks, inlets, &c., according to their forms and dimensions. The bed of the ocean appears to present the same irregularities as the surface of the land, being diversified by rocks, mountains, plains, and deep valleys. The level of the ocean, generally speaking, is everywhere the same, but the disturbing actions of the sun and moon, of the winds, and of currents occasion slight inequalities. The extreme depth of the ocean hitherto sounded is 4665 fathoms, which was found off the Kurile Islands in the North Pacific. The saltiness of the ocean is due to the presence of various saline ingredients (chiefly chloride of sodium or common salt), which are generally found in the proportion of from 30 to 40 per thousand. Recent observations have shown that the colour and transparency of the water of the ocean are in a large measure dependent on the degree of saltiness. In general it is found that the greater the saltiness, the greater the transparency, and also that where the saltiness is very great the water is of a dark blue colour, that where it is less the water is of lighter blue, inclining to green, and that in the neighbourhood of rivers (where the saltiness is reduced to a minimum) the water is as a rule of a greenish yellow.—2. An immense expanse; as, the boundless *ocean* of eternity; *oceans* of duration and space.

I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the sea-shore, and diverting myself in now and then finding a smoother pebble, or a prettier shell than ordinary, while the great ocean of truth lay all undiscovered before me. *Newton*.

burning with a more or less luminous flame. The oils are usually divided into the *fat* or *fixed* oils, and the *volatile* or *essential* oils.

The name oil is also popularly given to certain inflammable substances, such as naphtha or petroleum (mineral oils).

Fuel oils are subdivided into the *drying* and the *non-drying* oils. The former class includes all oils which thicken when exposed to the air through the absorption of oxygen, and are converted thereby into varnish, as for example linseed, nut, poppy, and hempseed oil. The non-drying oils when exposed to the air also undergo a change resulting in the formation of acid, disagreeably smelling, acid substances. This decomposition, which is only partial, seems to be brought about by the presence of cellular matter derived from the plant or animal which has yielded the oil, this substance acting as a ferment on the fatty matter, and such acids as butyric, caproic, valeric, &c., being thereby produced. The fixed vegetable oils are generally prepared by subjecting the seeds of the plant to pressure, the animal oils are, for the most part, the fluid parts of the fat of the animal. Vegetable fixed oils are lighter than water, viscous and insipid, or nearly so; they all consist of two proximate principles, *stearins* and *oleins*. They are sources of artificial light, and when acted on by an alkali form soaps. *Volatile oils* are generally obtained by distilling the vegetables which afford them with water; they are acrid, caustic, aromatic, and limpid; they are mostly soluble in alcohol, forming essences. They boil at a temperature considerably above that of boiling water, some of them undergoing partial decomposition. A few of them, such as oil of turpentine, of lemon peel, of capivi balsam, &c., are hydrocarbons, the greater number, however, contain oxygen as one of their ultimate elements. They are chiefly used in medicine and perfumery; and a few of them are extensively employed in the arts as vehicles for colours, and in the manufacture of varnishes, especially oil of turpentine. — *Oil* of *hale*, a mottum formerly famous as a cosmetic, probably because that mineral, when calcined, became very white, and was considered a fit substitute for ceruse.

He should have brought me some fresh oil of hale. *Massinger*.

Rape-cake is used as a fattening food for sheep. These and other oil-cakes are also valuable as manures. — *Oil-cake* mill, a mill for crumbling down oil-cakes.

tree, in height from 20 to 30 feet, with stiff narrow dark-green or bluish leaves. The flowers are produced in small axillary bunches, and appear in June, July, and August. The fruit is a berryed drupe of an oblong spheroidal form, with a thin, smooth, and usually blackish skin, containing a greenish soft pulp adherent to a rough, oblong, and very hard stone. It is bitter and nauseous, but repete with a bland oil. The olive is a native of Syria and other Asiatic countries, and flourishes only in warm and comparatively dry parts of the world. It grows slowly, and is very long-lived. The olive-tree has in all ages been held in peculiar estimation. It was anciently sacred to Minerva. Olive wreaths were used by the Greeks and Romans to crown the brows of victors, and it is still universally regarded as an emblem of peace. The wood of the olive-tree is beautifully veined, and has an agreeable smell. It is in great esteem with cabinet-makers, on account of the fine polish of which it is susceptible. But the olive-tree is principally cultivated for the sake of its oil, which is contained in the pericarp. (See **OLIVE-OIL**.) It is cultivated for this purpose in Italy, France, Spain, Malta, Turkey, the Ionian Islands, &c. Another species of olive, the *O. fragrans*, inhabits China, Japan, and Cochinchina. The flowers are used by the Chinese to mix with and perfume their tea, and also, together with the leaves, for adulterating tea. It is the lightest of all the fixed oils. There are four different kinds of olive-oil known in the districts where it is prepared. (a) That which is expressed from the ripe fruit immediately after it is gathered, and is not esteemed. (b) *Second oil*, or *dinary oil*, previously cru water, or made been used to (c) *Oil of the in* collected from which has been operation, after volta for some in lamps; hence called also *lamp oil*. The best olive-oil is said to be made in the vicinity of Aix, in France; the kind known by the name of Florence oil is also of a superior quality, and is mostly used for culinary purposes. Like some others of the same family of plants.

Ontogeny and *phylogenesis* stand in the closest possible connection, and the one cannot be understood without the other. This fundamental biological law, upon which the comprehension of the entire doctrine of organic evolution absolutely depends, may be shortly expressed thus.—The history of the germ is an abstract or epitome of that of the race. In other words, *ontogeny* is a brief recapitulation of *phylogenesis*, or, in somewhat greater detail, that.—The series of forms presented by the individual organism during its development from the original germ to the perfect condition is a short and compressed repetition of the long series of forms presented by the ancestors of this organism, from the earliest periods of the so-called organic creation up to the present time.

Ontogenetic (on-to-jen'-ee-ick), *n.* Of, pertaining to, or relating to ontogeny.

Ontogenetically (on-to-jen'-ee-ick-lee), *adv.* In an ontogenetic manner; by way of ontogenesis (which see).

Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. The satellites also move in elliptical orbits, having their respective primaries in one of the foci. Ordinance (or'din-ans), *n.* [Formerly *ordinances*, *ordenance*, *ordenance*, artillery, the same word as *ordnance*, Fr. *ordnance*, arrangement, disposition, equipment. *Ordinance* has probably come to have its present meaning by the suppression of a portion of a designation of which it formed part; and from having such a meaning as 'equipment' it has come to be applied to a particular kind of military equipment or appliance. Wedgwood quotes a passage from an old chronicle in which the translation of meaning seems to appear: 'The *ordenance* of the kinges guns avayled not, for that day was so grete rayne that the gonnes lay depe in the water, and so were queynt and might not be schott.'] Cannon or great guns, mortars, and howitzers; artillery.—*Board of ordnance*, the name given to a board, consisting of a master-general, surveyor-general, clerk, and store-keeper, which formerly provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of forage for the troops at home, the erection of fortifications, &c. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterwards dissolved, the duties being divided among different branches of the war office.—*Ordinance survey*, the survey of Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties, and rivers, roads, houses, &c., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4000 or more inhabitants, $\frac{1}{62500}$ th of

the linear measurement, which is equivalent to 126.72 inches to a mile, or an inch to 413 feet; for parishes (in cultivated districts), $\frac{1}{17500}$ th of the linear measurement, equal to 25.344 inches to a mile, or 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are, as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be raised, and roads, railways, canals, and other public works laid out and executed.

Organ (ör-gan), *n.* [L. *organum*, from Gr. *organon*, an instrument, implement, engine, from *ergō*, for *uegō* or *vego*, to work, from the same root as that of E. *work*.] 1. In the widest sense, an instrument or means; that which performs some office, duty, or function; that by which some important action is performed or object accomplished: in a narrow and more common sense, a part of an animal or vegetable body by which some action, operation, or function is carried on. Thus the heart, arteries, and veins of animals are *organs* of circulation; the lungs are *organs* of respiration; the nose is the *organ* of smell, the eye of sight; both plants and animals have reproductive *organs*.

For you must know, we have Lent him our terror, dress'd him with our love, And given his deputation all the *organs* Of our own power. *Shak.*

The vocal *organs* collectively; the voice. 'Thy small pipe is as the maiden's *organ* shrill.' *Shak.* The term is still technically used, as when we say that such a singer has a magnificent *organ*.—4.† A wind musical instrument in general: Shakespeare applies the term to a pipe, and perhaps that is the meaning in quotation under 3.—5. The largest and most harmonious of wind instruments of music, consisting of a great number of pipes of different sizes, formed of wood and of different

kinds of metal, some of which are flute-pipes, or mouth-pipes, and others reed-pipes, all of them being made to sound by means of compressed air applied to them through certain channels by bellows worked either by human force or by steam or otherwise. An organ may have several wind-chests filled by the same bellows, and several key-boards, each key board and wind-chest representing a distinct organ. In the largest instruments the number of these organs generally amounts to five—viz. the *great organ*, the *choir organ*, the *swell organ*, the *solo organ*, and the *pedal organ*. The key-boards for the hand are termed *manuels*, that for the feet the *pedal*. The most usual compass of the manuels is from C₂ (2 feet) to F in alt. four octaves and a half, that of the pedal from C₂ to E or F, two and a quarter to two and a half octaves, but this range is increased by stops which give a note an octave, or in the pedal organ even two octaves lower, and sometimes one of the harmonics higher in pitch. — *Barrel-organ*. See *BARREL-ORGAN*. — *Chamber-organ*. Same as *Chamber-organ* (which see).

Organic (or'gan-ik), *a*. [L. *organicus*, from *organum*, an implement. See *ORGAN*.] 1. Pertaining to an organ or to organs of animals and plants; as, an *organic function*, an *organic disease*. — 2. Pertaining to objects that have organs, hence to the animal and vegetable worlds, pertaining to or exhibiting characteristics peculiar to animal or vegetable life and structure, as, *organic bodies*; *organic life*, *organic remains*.

The term '*organic*' as applied to any substance, is in way relevant to the presence or absence of life. The materials which compose the living body are of course *organic*. In the main, but they are equally so after death has occurred—at any rate for a certain time—and some of them continue to be so for an indefinite period after life has departed. Sugar, for example, is an *organic* product, but in itself it is of course dead, and it ceases to be so only after the organism which produced it has lost all vitality. *N. A. Nicholson*.

See **INORGANIC**. — 3. Forming a whole with a systematic arrangement of parts; organized, systematized.

tions without being readily decomposed by the chemical changes. — *Organic remains*, the name given to those organized bodies, whether animals or vegetables, found in a fossil state. Certain families of animals are found pervading strata of every age, and possessing the same generic forms which are to be found among existing animals. There are, however, other families, both animal and vegetable, which are confined to particular formations, their disappearance and replacement by distinct forms being apparently sudden, while the changes of genera and species are still more frequent. It is in the paleozoic series that the remains of organized beings begin to be found, and already we find there the remains of all divisions of the animal kingdom, Vertebrata, Mollusca, Articulata, Zoophytes, even Protozoa. In the secondary strata we find a series of saurian reptiles, and animals strangely uniting the characters of bird and reptile. The reptiles are principally of a gigantic size, many of them marine, others amphibious, and others terrestrial. In the tertiary series we find that the fossil remains of both animals and vegetables are much more numerous, and belong to higher types, and that they bring us down, by a natural transition, to those of our own times. A similar succession of vegetable remains have been obtained from rocks of various ages. See *GEOLOGY*.

Some of the members have a distinct heart, as those of the genus *Cypridina*, but it is wanting in most. Fr. *autruche*, Sp. *avestruz*, from L. *avis*, a bird, and *struthio*, Gr. *struthion*, an ostrich.] A large cursorial bird of the genus *Struthio*, family Struthionidae. The true or African ostrich (*S. camelus*) inhabits the sandy plains of Africa and Arabia, and is the largest of all existing birds, attaining a height of from 6 to 8 feet. The head and neck are nearly naked, and the quill-feathers of the wings and tail have their barbs wholly disconnected. It is for these white plumes that the bird is chiefly hunted and re

other hard materials that come in the way. Ostriches are polygamous, each male consorting with several females, and they generally keep together in larger or smaller flocks. The eggs are of great size, averaging 3 lbs. each in weight, and several hens often lay in the same nest, which is merely a hole scraped in the sand. The eggs appear to be hatched mainly by the exertions of both parents relieving each other in the task of incubation, but also partly by the heat of the sun. The South African ostrich is often considered as a distinct species under the name of *S. australis*. Three South American birds of the same family (Struthionidae), but of the genus *Rhea*, are popularly known as the American ostrich, and are very closely allied to the true ostrich, differing chiefly in having three-toed feet and each toe armed with a claw. The best known of the three is *R. americana*, the *mandu*, or *mandu-guacu* of the Brazilians, inhabiting the great American pampas south of the equator. It is considerably smaller than the true ostrich, and its plumage is much inferior. *R. Darwini*, a native of Patagonia, is still smaller. Oxygen (oks'ī-jen), *n.* [*Gr. oxy*, acid, and *gennao*, to generate.] 1. Sym. O. At. wt. 16. In *chem.* a gaseous element discovered by Priestley in 1776, by whom it was named *dephlogisticated air*; by Scheele it was named *emphyreal air*, and by Condorcet *vital air*. It constitutes about one-fifth of the total volume of the atmosphere, and is the supporter of ordinary combustion. It was named oxygen because it was supposed to be present in all acids; modern experiments, however, prove that it is not necessary in all cases to acidity or to combustion. Oxygen may be prepared by heating manganic dioxide or potassic chlorate; it is usually obtained from a mixture of these two salts. Oxygen is a permanently elastic fluid, invisible, inodorous, and a little heavier than atmospheric air. In mechanical mixture with nitrogen it forms atmospheric air. Water contains about 80 per cent of it, and it exists in most vegetable and animal products, acids, salts, and oxides. It is soluble in water to the extent of 30 centimetres of the gas to 1 litre of water, and this property is of great importance in relation to plants, and still more to water animals, the greater number of which are dependent on this dissolved oxygen for the support of respiration and life. It has a powerful attraction for most of the simple substances, especially for the electro-positive bodies, the act of combining with which is called oxidation. The compounds thus formed are called *oxides*. Oxidation is often attended with the evolution of heat and light, as in all processes of combustion in atmospheric air; sometimes the oxidation is slow and unattended with such phenomena, as in the gradual rusting of metals. Combustion is the union of inflammable matter with oxygen. (See COMBUSTION.) Oxygen gas is necessary to re-

It also exists in the roots of rhubarb, bistort, gentian, etc., combined with potash; in several kinds of lichens it is found in union with lime. It forms the juice sold under the erroneous name of *salt of lemon*. It is a violent poison.

MINERVA.—2. One of the four small planets revolving between the orbits of Mars and Jupiter, discovered by Dr. Olbers, at Bremen, March 24, 1802. On account of the minuteness of this planet, and the nebulous appearance by which it is surrounded, it is extremely difficult to arrive at any certain conclusion respecting its real magnitude. Its diameter has been estimated at 177 miles, and its period of revolution 461 years. Its light undergoes considerable variations, and its motion in its orbit is greatly disturbed by the powerful attraction of Jupiter.

Palmaceae (pal-mā-sē), *n. pl.* [*L. palma*, the palm of the hand, a palm-tree — from its leaves spreading like the palm of the hand.] The Palma, a nat. order of arborescent endogens, chiefly inhabiting the tropics, distinguished by their feathery, colour-

less, six-parted flowers, inclosed within spathe; their minute embryo lying in the midst of albumen, and remote from the hilum; and their arborescent stems with rigid, plaited, or pinnated inarticulated leaves, sometimes called fronds. The palms are among the most interesting races of plants in the vegetable kingdom, from their beauty, variety, and associations, as well as from their great value to mankind as affording food, raiment, and numerous objects of economical importance. While some, as *Kunkia montana*, *Oreodera frigida*, have trunks as slender as the reed, or longer than the longest cable (*Calamus rudens* being 800 feet), others, as *Jubaea spectabilis* and *Cocco butyracea*, are 3 and even 6 feet thick; while some are of low growth, as *Attalea amygdalina*, others exhibit a stem towering from 160 to 180 feet high, as *Ceroxylon andicola* or wax-palm of South America. Also, while they generally have a cylindrical undivided stem, *Hyphomys thebaica* (the doum palm of Upper Egypt) and *Hyphomys coriacea* are remarkable for their repeatedly divided trunk. About 600 species are known, but it is probable that many are still undescribed. Wine, oil, wax, flour, sugar, salt, are the produce of palms, to which may be added thread, utensils, weapons, food, and habitations. There is scarcely a single species in which some useful property is not found. The coconut, the date, and others are valued for their fruit; the cabbage-palm, for its edible terminal buds; the fan-palm, and many more, are valued for their foliage, whose hardness and durability render it an excellent material for thatching; the sweet jules of the Palmyra and others, when fermented, yields wine, the centre of the sagopalm abounds in nutritive starch; the trunk of the *Ceroxylon* exudes a valuable wax; oil is expressed in abundance from the oil-palm; an astringent matter resembling dragon's blood is produced by *Calamus Dresco*; many of the species contain so hard a kind of fibrous matter that it is used instead of needles, or so tough that it is manufactured into cordage; and, finally, their trunks are, in some cases, valued for their strength, and used as timber, or for their elasticity or flexibility, as in the cane-palm. Descriptions and illustrations of many of the palms will be found in separate articles scattered through this book.
